Week 1 - Programming Assignment [optional]

TOTAL POINTS 1

1. Many Time Pad

1 / 1 point

Let us see what goes wrong when a stream cipher key is used more than once. Below are eleven hex-encoded ciphertexts that are the result of encrypting eleven plaintexts with a stream cipher, all with the same stream cipher key. Your goal is to decrypt the last ciphertext, and submit the secret message within it as solution.

Hint: XOR the ciphertexts together, and consider what happens when a space is XORed with a character in [a-zA-Z].

ciphertext #1:

```
315c4eeaa8b5f8aaf9174145bf43e1784b8fa00dc71d885a804e5ee9fa40b16349c146fb778cdf2d3aff021d

```

target ciphertext (decrypt this one):

```
32510ba9babebbbbef001547a810e67149caee11d945cd7fc81a05e9f85aac650e9052ba6a8cd8257bf14d1
3e6f0a803b54fde9e77472dbff89d71b57bddef121336cb85ccb8f3315f4b52e301d16e9f52f904
```

For completeness, here is the python script used to generate the ciphertexts.

(it doesn't matter if you can't read this)

```
1 import sys
2
3 MSGS = ( --- 11 secret messages --- )
4
5 def strxor(a, b):    # xor two strings of different lengths
6     if len(a) > len(b):
7         return "".join([chr(ord(x) ^ ord(y)) for (x, y) in zip(a[:len(b)], b)])
8     else:
9         return "".join([chr(ord(x) ^ ord(y)) for (x, y) in zip(a, b[:len(a)])])
10
11 def random(size=16):
12     return open("/dev/urandom").read(size)
13
14 def encrypt(key, msg):
15     c = strxor(key, msg)
16     print
17     print c.encode('hex')
18     return c
19
20 def main():
21     key = random(1024)
22     ciphertexts = [encrypt(key, msg) for msg in MSGS]
```

Enter the decrypted message in the box below.

The secret message is: When using a stream cipher, never use the key more than once

✓ Correct
