GRADE 93.33%

## Week 5 - Problem Set

LATEST SUBMISSION GRADE 93.33%

1. Consider the toy key exchange protocol using an online trusted 3rd party

0 / 1 point

(TTP) discussed in  $\underline{\text{Lecture 9.1}}.$  Suppose Alice, Bob, and Carol are three

users of this system (among many others) and each have a secret key

with the TTP denoted  $k_a$ ,  $k_b$ ,  $k_c$  respectively. They wish to

generate a group session key  $k_{ABC}\,$  that will be known to Alice,

Bob, and Carol but unknown to an eavesdropper. How

would you modify the protocol in the lecture to accommodate a group key

exchange of this type? (note that all these protocols are insecure against

active attacks)

 $\bigcirc$  Alice contacts the TTP. TTP generates a random  $k_{AB}$  and a random  $k_{AC}$  . It sends to Alice

$$E(k_a, k_{AB}), \quad \mathrm{ticket}_1 \leftarrow E(k_b, k_{AB}), \quad \mathrm{ticket}_2 \leftarrow E(k_c, k_{AC}).$$

Alice sends  $ticket_1$  to Bob and  $ticket_2$  to Carol.

 $\bigcirc$  Alice contacts the TTP. TTP generates a random  $k_{ABC}$  and sends to Alice

$$E(k_a, k_{ABC}), \quad \text{ticket}_1 \leftarrow k_{ABC}, \quad \text{ticket}_2 \leftarrow k_{ABC}.$$

Alice sends  $ticket_1$  to Bob and  $ticket_2$  to Carol.

igotimes Bob contacts the TTP. TTP generates a random  $k_{AB}$  and a random  $k_{BC}$  . It sends to Bob

$$E(k_a,k_{AB}), \quad \text{ticket}_1 \leftarrow E(k_a,k_{AB}), \quad \text{ticket}_2 \leftarrow E(k_c,k_{BC}).$$

Bob sends  $ticket_1$  to Alice and  $ticket_2$  to Carol.

igcup Alice contacts the TTP. TTP generates random  $k_{ABC}$  and sends to Alice

$$E(k_a, k_{ABC}), \quad \text{ticket}_1 \leftarrow E(k_b, k_{ABC}), \quad \text{ticket}_2 \leftarrow E(k_c, k_{ABC}).$$

Alice sends  $ticket_1$  to Bob and  $ticket_2$  to Carol.

Incorrect

The protocol does not work because Alice, Bob, and Carol end up with different keys.

2. Let G be a finite cyclic group (e.g.  $G=\mathbb{Z}_p^*$ ) with generator g.

1/1 point

Suppose the Diffie-Hellman function  $\mathrm{DH}_g(g^x,g^y)=g^{xy}$  is difficult to compute in G. Which of the following functions is also difficult to compute?

As usual, identify the f below for which the contra-positive holds: if  $f(\cdot,\cdot)$  is easy to compute then so is  $\mathrm{DH}_g(\cdot,\cdot)$ . If you can show that then it will follow that if  $\mathrm{DH}_g$  is hard to compute in G then so must be f.

✓ Correct

an algorithm for calculating  $f(\cdot,\cdot)$  can

easily be converted into an algorithm for

calculating  $\mathrm{DH}(\cdot,\cdot)$ .

Therefore, if f were easy to compute then so would  $\operatorname{DH}$ ,

contrading the assumption.

 $f(g^x, g^y) = g^{x-y}$ 

 $\qquad \qquad f(g^x,g^y)=g^{x(y+1)}$ 

✓ Corre

an algorithm for calculating  $f\left(g^{x},g^{y}
ight)$  can

easily be converted into an algorithm for

```
calculating \mathrm{DH}(\cdot,\cdot).
             Therefore, if f were easy to compute then so would \mathrm{DH},
            contrading the assumption.
3. Suppose we modify the Diffie-Hellman protocol so that Alice operates
                                                                                                                              1/1 point
    as usual, namely chooses a random a in \{1,\dots,p-1\} and
    sends to Bob A \leftarrow g^a. Bob, however, chooses a random b
    in \{1,\ldots,p-1\} and sends to Alice B \leftarrow g^{1/b} . What
    shared secret can they generate and how would they do it?
    igotimes secret =g^{a/b}. Alice computes the secret as B^a
         and Bob computes A^{1/b}.
    \bigcirc secret =g^{a/b}. Alice computes the secret as B^{1/b}
         and Bob computes A^a.
    \bigcirc secret = g^{a/b}. Alice computes the secret as B^{1/a}
         and Bob computes {\cal A}^b.
    \bigcirc secret =g^{b/a}. Alice computes the secret as B^a
         and Bob computes A^{1/b}.
        ✓ Correct
            This is correct since it is not difficult to see that
            both will obtain g^{a/b}
                                                                                                                              1/1 point
4. Consider the toy key exchange protocol using public key encryption described in Lecture 9.4.
    Suppose that when sending his reply c \leftarrow E(pk,x) to Alice, Bob appends a MAC t := S(x,c) to the
    ciphertext so that what is sent to Alice is the pair (c,t). Alice verifies the tag t and rejects the
    message from Bob if the tag does not verify.
    Will this additional step prevent the man in the middle attack described in the lecture?
    it depends on what MAC system is used.
    no no
    it depends on what public key encryption system is used.
        ✓ Correct
            an active attacker can still decrypt E(pk^\prime,x) to recover x
            and then replace (c,t) by (c',t')
            where c' \leftarrow E(pk,x) and t \leftarrow S(x,c').
5. The numbers 7 and 23 are relatively prime and therefore there must exist integers a and b such that
    Find such a pair of integers (a,b) with the smallest possible a>0.
    Given this pair, can you determine the inverse of 7 in \mathbb{Z}_{23}?
    Enter below comma separated values for a,\ b , and for 7^{-1} in \mathbb{Z}_{23} .
      10,-3,10
        / Correct
            7 \times 10 + 23 \times (-3) = 1.
             Therefore 7 	imes 10 = 1 in \mathbb{Z}_{23} implying
            that 7^{-1}=10 in \mathbb{Z}_{23}.
6. Solve the equation 3x + 2 = 7 in \mathbb{Z}_{19}.
                                                                                                                              1/1 point
```

 $x=(7-2) imes 3^{-1}\in \mathbb{Z}_{19}$ 

7. How many elements are there in  $\mathbb{Z}_{35}^*$  ?

1/1 point

24

 $\checkmark$  Correct  $|\mathbb{Z}^*_{35}| = \varphi(7 \times 5) = (7-1) \times (5-1).$ 

8. How much is  $2^{10001} \bmod 11$  ?

1 / 1 point

Please do not use a calculator for this. Hint: use Fermat's theorem.

2

 $\checkmark$   $\;$  Correct  $\label{eq:correct} \;$  By Fermat  $2^{10}=1$  in  $\mathbb{Z}_{11}$  and therefore

$$1=2^{10}=2^{20}=2^{30}=2^{40}$$
 in  $\mathbb{Z}_{11}.$  Then  $2^{10001}=2^{10001}$ mod $10=2^1=2$  in  $\mathbb{Z}_{11}.$ 

9. While we are at it, how much is  $2^{245} \bmod 35$ ?

1/1 point

Hint: use Euler's theorem (you should not need a calculator)

32

✓ Correct

By Euler  $2^{24}=1$  in  $\mathbb{Z}_{35}$  and therefore

$$1 = 2^{24} = 2^{48} = 2^{72}$$
 in  $\mathbb{Z}_{35}$ .

Then 
$$2^{245}=2^{245 mod 24}=2^5=32$$
 in  $\mathbb{Z}_{35}.$ 

10. What is the order of 2 in  $\mathbb{Z}_{35}^*$ ?

1/1 point

12

✓ Correct

$$2^{12}=4096=1$$
 in  $\mathbb{Z}_{35}$  and 12 is the

smallest such positive integer.

11. Which of the following numbers is a

1/1 point

generator of  $\mathbb{Z}_{13}^*$ ?

 $\checkmark$  Correct correct, 6 generates the entire group  $\mathbb{Z}_{13}^*$ 

7, 
$$$$ 77 = 1, 7, 10, 5, 9, 11, 12, 6, 3, 8, 4, 27$$

 $\checkmark$  Correct correct, 7 generates the entire group  $\mathbb{Z}_{13}^*$ 

12. Solve the equation  $x^2+4x+1=0$  in  $\mathbb{Z}_{23}$ .

1/1 point

Use the method described in <u>Lecture 10.3</u> using the quadratic formula.

14,5

✓ Correct

The quadratic formula gives the two roots in  $\mathbb{Z}_{23}.$ 

13.	What is the 11th root of 2 in $\mathbb{Z}_{19}$ ?	1/1 point
	(i.e. what is $2^{1/11}$ in $\mathbb{Z}_{19}$ )	
	Hint: observe that $11^{-1}=5$ in $\mathbb{Z}_{18}.$	
	13	
	$\checkmark$ correct $2^{1/11}=2^5=32=13 \text{ in } \mathbb{Z}_{19}.$	
14.	What is the discete log of 5 base 2 in $\mathbb{Z}_{13}$ ? (i.e. what is $\mathrm{Dlog}_2(5)$ )	1/1 point
	Recall that the powers of 2 in $\mathbb{Z}_{13}$ are $\left\langle 2\right\rangle =\left\{ 1,2,4,8,3,6,12,11,9,5,10,7\right\}$	
	9	
	$\checkmark$ Correct $2^9=5$ in $\mathbb{Z}_{13}.$	
15.	If $p$ is a prime, how many generators are there in $\mathbb{Z}_p^*$ ?	1/1 point
	$\bigcirc$ $\varphi(p-1)$	
	(p+1)/2	
	$\bigcirc (p-1)/2$	
	$\bigcirc \varphi(p)$	
	$\checkmark$ Correct $ \text{The answer is } \varphi(p-1). \text{ Here is why. Let } g \text{ be some generator of } \mathbb{Z}_p^* \text{ and let } h=g^x \text{ for some } x. $ It is not difficult to see that $h$ is a generator exactly when we can write $g$ as $g=h^y$ for some integer	r $y$ ( $h$ is a generator because if $g=h^y$ then any power of $g$ can also be written as a power of $h$

Since  $y=x^{-1} \mod p-1$  this y exists exactly when x is relatively prime to p-1. The number of such x is the size of  $\mathbb{Z}_{p-1}^*$  which is precisely  $\varphi(p-1)$ .
